

User Acceptance Testing (UAT) Project

Date	02 October 2026
Team ID	SWTID-2026-1180
Project Name	Implement Client Script and UI Policy(incidents)
Maximum Marks	4 Marks

Comprehensive Implementation & Execution Documentation

This document outlines the end-to-end framework for planning, executing, and validating User Acceptance Testing (UAT) to ensure business requirements and user workflows are fully met prior to production release.

1. UAT Strategy & Scope Definition

Establishes business objectives, testing boundaries, stakeholder roles, and entry/exit criteria to align technical deliverables with end-user expectations.

2. Business Scenario Identification

Collaborates with product owners and business analysts to map real-world operational workflows into comprehensive end-to-end test scenarios.

3. Test Environment Provisioning

Configures a dedicated UAT staging environment mirroring production data security, integrations, and user permission roles.

4. Test Case Authoring & Mapping

Develops detailed step-by-step UAT test cases mapped directly back to initial functional requirements and user story acceptance criteria.

5. Stakeholder Onboarding & Training

Equips business testers and end-user representatives with execution guidelines, test management tool access, and defect reporting protocols.

6. Execution & Defect Triage

Executes test scripts across user cohorts, logging defects in real-time and collaborating with development to triage severity and blockers.

7. Test Mandatory Field & Rule Enforcement

Verifies that required fields, business rules, and UI constraints successfully block invalid actions and display appropriate error prompts.

8. Test Successful End-to-End Workflow

Confirms that valid multi-step user transactions process seamlessly from initiation through to completion without runtime errors.

9. Reverse Condition & Exception Testing

Verifies that system behavior and UI elements correctly revert or adapt when conditional triggers or inputs are altered or removed.

10. Test Role-Based Access Control (RBAC)

Verifies that restricted features, data views, and approval actions adhere strictly to assigned user permissions and security profiles.

11. Test Data Logging & Audit Trails

Verifies that system interactions, transaction states, and user submissions are accurately tracked, timestamped, and logged for auditing.

12. UAT Sign-Off & Release Readiness

Synthesizes test execution metrics, open defect counts, and stakeholder approvals to grant formal sign-off for production deployment.

13. Conclusion

Rigorous User Acceptance Testing bridges the gap between technical implementation and business value, ensuring seamless adoption and high-quality software delivery.
