

Date	02 October 2026
Team ID	SWTID-2026-1180
Project Name	Implement Client Script and UI Policy(incidents)
Maximum Marks	4 Marks

CUSTOMER JOURNEY MAP

Journey Phase	1. Entice (Discovery & Form Access)	2. Enter (Form Initialization & Scoping)	3. Engage (Data Entry & Live Validation)	4. Exit (Submission Gatekeeping)	5. Extend (Post-Submission & Triage)
Description	How the user becomes aware of and accesses the IT support request portal.	What the user experiences as they begin filling out the form.	In the core moments of data entry, what happens?	What the user experiences as the process finishes/submits.	What happens after the experience is successfully completed?
Steps	• Navigates to IT Self-Service Portal • Selects "Create Incident" • Lands on intake form	• Form loads initial profile context • User reads through static layout fields • User selects request Category	• User enters phone number or date format • User picks asset/CI tag • System runs background checks	• User clicks the final Submit button • Browser evaluates client validation rules	• Ticket is committed to the database • Auto-routing to support queue • Confirmation notification sent

Interactions	People: IT Support Desk / Peers Places: ServiceNow Portal / Intranet Things: Web browser, desktop or mobile view	People: N/A (Self-service) Places: Ticket Intake Form Things: Form fields, dropdown menus, UI Policy triggers	People: N/A Places: Form fields Things: Regex checks, <code>GlideAjax</code> asynchronous data fetchers	People: Fulfiller / Support Agent Places: Submission footer Things: Submit button, browser popup alerts	People: Assigned IT Fulfiller group Places: Incident Management Queue Things: Email alerts, SLA timers
Goals & Motivations	• "Help me find where to log my issue quickly."	• "Help me understand what fields are actually relevant to my problem."	• "Help me know if my input format is correct before I finish."	• "Help me submit this without getting blocked or losing my data."	• "Help my ticket get routed to the right team without delay."
Positive Moments	• Clean, fast portal load time.	• onLoad Script: Auto-fills user profile information seamlessly. • UI Policies: Instantly hide irrelevant fields, reducing visual clutter.	• onChange Script: Delivers instant inline formatting tips (<code>showFieldMsg</code>) without blocking user typing.	• onSubmit Script: Halts invalid submissions instantly in the browser without reloading the page or wiping text.	• High data quality captured on the first attempt. • Instant ticket confirmation and fast dispatch.
Negative Moments	• Finding the right	• Long, cluttered	• Uncertainty over required	• Fear of sudden server-	• Back-and-forth

	portal link can sometimes be confusing.	legacy forms presenting dozens of unnecessary options at once.	formats (e.g., phone, serial number) leading to hesitation.	side page reloads wiping all typed notes upon error rejection.	communication emails required if triage details are missing.
Areas of Opportunity	• Streamline portal landing page shortcuts for high-frequency requests.	• Expand declarative UI Policies across more catalog items to minimize visual overload.	• Enhance <i>GlideAjax</i> lookups to pull real-time asset contracts faster.	• Zero-page-reload error handling via strict client-side validations.	• Implement automated satisfaction surveys post-resolution to track efficiency gains.
