

ServiceNow Incident Form Implementation & Testing Project

Date	02 October 2026
Team ID	SWTID-2026-1180
Project Name	Implement Client Script and UI Policy(incidents)

Comprehensive Master Project Document: From Ideation and Architecture to UI Policies, Client Scripts, GenAI Testing, and UAT

1. Brainstorming & Idea Prioritization

Source Reference: Brainstorming and idea prioritization .pdf

Evaluates raw project concepts for ServiceNow form customization, categorizes incident backlog items, and applies weighted scoring models to prioritize high-impact enhancements.

2. Empathize & Discover

Source Reference: empathize and discover.pdf

Gathers stakeholder feedback, support agent pain points, and operational hurdles on the Incident table to build a solution centered around real-world user needs.

3. Define Problem Statements

Source Reference: Define Problem Statements.pdf

Synthesizes discovery insights into clear, actionable problem statements regarding slow form response, unvalidated data entries, and cluttered UI layouts on incident tickets.

4. Customer Journey Map

Source Reference: customer journey map.pdf

Maps out end-to-end incident management touchpoints, agent emotional states, and operational friction points across the ticket lifecycle.

5. Data Flow Diagrams & User Stories

Source Reference: Data Flow Diagrams and User Stories.pdf

Defines technical data exchanges, client-server boundaries, and user stories formatted for agile sprint execution of ServiceNow client scripts.

6. Solution Requirement Fit

Source Reference: solution requirement fit.pdf

Validates functional and non-functional requirements against ServiceNow platform capabilities to ensure complete architectural alignment.

7. Problem-Solution Fit & Proposed Solution

Source Reference: problem solution fit 1.pdf / proposed solution fit 1.pdf

Demonstrates direct alignment between identified incident management bottlenecks and the proposed four-layer client-side architecture (Browser Runtime, Async Offload, Submission Gatekeeper, and Database Persistence).

8. Technology Stack

Source Reference: technology stack 1.pdf

Outlines the core software frameworks, ServiceNow platform version, JavaScript API libraries (GlideForm, GlideAjax), and hosting environments utilized.

9. Solution Architecture

Source Reference: solution architecture fit 2.pdf

Details the multi-layered system design, script execution order (`onLoad`, `onChange`, `onSubmit`, `onCellEdit`), and integration points required for stable incident execution.

10. Project Planning

Source Reference: project planning fit 1.pdf

Establishes sprint timelines, milestone phases, resource allocation schedules, and deployment strategies for ServiceNow update sets.

11. UI Policy & Client Script Implementation

Source Reference: creation of ui policy.png / create client scripts.png

Implements dynamic UI policies (Hardware category asset mandatory toggles and Urgency justification fields) alongside responsive Client Scripts for live validation and error handling.

12. Gen AI Ad Performance Testing

Source Reference: Gen_AI_Ad_Performance_Testing_Document 1.pdf

Integrates generative AI for creative ideation, prompt-based variant generation, persona simulation, synthetic CTR prediction, and real-time budget optimization [cite: 4].

13. User Acceptance Testing (UAT)

Source Reference: User_Acceptance_Testing_Document 1.pdf

Executes end-to-end UAT protocols including mandatory field verification, workflow validations, role-based access control (RBAC), and formal stakeholder sign-off [cite: 5].
