

PROJECT DESIGN PHASE III

SOLUTION ARCHITECTURE FIT

Date	02 October 2026
Team ID	SWTID-2026-1180
Project Name	Implement Client Script and UI Policy(incidents)
Maximum Marks	4 Marks

Solution architecture:

Step 1: Browser Runtime Layer (🟦)	Step 2: Asynchronous Offload (⚙️)	Step 3: Submission Gatekeeper (🛡️)	Step 4: Database Persistence (🟩)
- onLoad Profile Setup & Session Context - Dynamic UI Policies (Show/Hide) - onChange Regex live inline validation	- GlideAjax background queries - Script Include backend verification - Zero UI freezing or latency	- onSubmit Client Script intercept - Safe abort without page reloads - Input text preservation & relief	- Clean, validated records committed - Zero triage bounces & fast routing - High user confidence & efficiency

Explanation

- **1. Browser Runtime Layer (Blue Column):** Pre-populates session user data via `onLoad` scripts and removes clutter using dynamic UI policies.
- **2. Asynchronous Offload (Grey Column):** Queries asset statuses in the background using `GlideAjax` without freezing the user interface.
- **3. Submission Gatekeeper (Orange Column):** Intercepts invalid entries via `onSubmit` scripts to prevent page reloads and protect user text.
- **4. Database Persistence (Green Column):** Commits clean data directly to ServiceNow for fast routing and error-free submissions.
