

PROJECT DESIGN PHASE II

TECHNOLOGY STACK

Date	02 October 2026
Team ID	SWTID-2026-1180
Project Name	Implement Client Script and UI Policy(incidents)
Maximum Marks	4 Marks

Technology Stack: ServiceNow Client Scripts & UI Policies Project

Layer / Domain	Technology Component	Usage & Role in Project
Platform & Core	ServiceNow ITSM / Custom App Engine	The core enterprise cloud platform hosting the incident, task, and service request tables.
Front-End Orchestration	ServiceNow UI Policies (No-Code)	Declarative configuration engine used to dynamically set fields to Visible, Mandatory, or Read-Only based on form conditions.
Client-Side Scripting	JavaScript (Client-Side APIs)	Custom scripts leveraging ServiceNow APIs (<code>g_form</code> , <code>g_user</code>) to execute realtime logic directly in the browser.
	• <code>onLoad</code> Scripts	Auto-populates session user details and sets initial form states upon opening.
	• <code>onChange</code> Scripts	Evaluates real-time regular expressions (Regex) and triggers inline validation messages (<code>g_form.showFieldMsg</code>).
	• <code>onSubmit</code> Scripts	Acts as a pre-submission gatekeeper to validate all form inputs and safely abort submissions (<code>return false</code>) without page reloads.
Asynchronous Architecture	GlideAjax & Script Includes	Asynchronous XMLHttpRequest framework used to query backend server records (such as CI asset warranties and status) without freezing the browser UI.
Database & Storage	ServiceNow Database Layer (MySQL/MariaDB underlying)	Stores fully validated, clean records inside standard (<code>incident</code>) or custom application tables.

Deployment & Packaging	ServiceNow Update Sets (.xml)	Packages all completed configurations, UI policies, client scripts, and script includes for seamless migration across development, test, and production instances.
